

# Job Description: Senior UX Frontend Engineer

Company: Acme Talent Cloud | Location: Remote LATAM | Employment Type: Full-time

---

## Role Overview

Acme Talent Cloud is looking for a Senior UX Frontend Engineer to help build intuitive, accessible, and scalable interfaces for an AI-assisted hiring platform. The ideal candidate combines strong React and TypeScript skills with a product mindset, UX sensitivity, and the ability to collaborate with design, backend, QA, and product stakeholders.

## Key Responsibilities

- Build high-quality React and TypeScript interfaces for admin dashboards, candidate flows, chat experiences, and reporting views.
- Translate Figma designs into responsive, accessible, and production-ready components.
- Create reusable UI components and contribute to a lightweight design system.
- Integrate with REST APIs for interview creation, document upload, analysis, answer submission, transcript retrieval, and report generation.
- Collaborate with backend engineers to define clear request/response contracts and handle loading, empty, and error states gracefully.
- Improve frontend performance by reducing unnecessary renders, optimizing bundle size, and using appropriate caching patterns.
- Add meaningful tests using Vitest, React Testing Library, and mock API responses.
- Participate in product discussions and suggest UX improvements based on user flows and usability concerns.

## Required Skills

- 5+ years of frontend development experience with modern JavaScript and React.
- Strong TypeScript knowledge and experience designing typed API models.
- Experience building component-based UIs with clean state management and reusable patterns.
- Solid understanding of HTML semantics, CSS layouts, responsive design, and accessibility basics.
- Experience consuming REST APIs and handling async states in production apps.
- Testing experience with Vitest, Jest, React Testing Library, Cypress, or Playwright.
- Ability to review UX details such as spacing, copy clarity, form feedback, focus states, and error handling.
- Good communication skills in cross-functional teams.

## Nice to Have

- Experience with AI-powered products, chat interfaces, or structured LLM outputs.
- Experience with design systems, Storybook, Tailwind, or component libraries.
- Knowledge of frontend observability, analytics, and user behavior tracking.
- Basic backend understanding with FastAPI, Node.js, or similar frameworks.
- Familiarity with cloud-hosted databases or services such as Supabase.

## Example First Projects

- Refactor a candidate interview chat screen into smaller reusable components.

- Improve the admin interview creation flow with clearer validation and loading states.
- Add frontend tests around document upload, answer submission, and report rendering.
- Collaborate with backend engineers to stabilize API contracts for adaptive interview flows.

## Evaluation Criteria

|               |                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------|
| Technical     | React architecture, TypeScript correctness, API integration, tests, performance awareness.         |
| UX            | Attention to usability, accessibility, responsive design, clear user feedback, visual consistency. |
| Collaboration | Clear communication, pragmatic tradeoffs, ability to work with product/design/backend teams.       |
| Ownership     | Ability to deliver production-ready features while keeping the MVP simple and maintainable.        |

## Interview Exercise

Candidates may be asked to review a small React feature, explain component extraction decisions, discuss state management tradeoffs, and propose improvements to a chat-based AI interview interface.

Note: This is a fictional job description created for testing and demo purposes.
