

Role Description: Senior Full Stack Engineer

Company: FinTech Solutions Group **Location:** Hybrid / Remote **Employment Type:** Full-time

About the Role

- We are looking for a Senior Full Stack Engineer to help design, build, and maintain scalable web applications for financial services products.
- The engineer will work across backend services, frontend interfaces, cloud infrastructure, APIs, and integrations with external platforms.
- This role requires strong ownership, clear communication, and the ability to collaborate with product, design, QA, DevOps, and architecture teams.

Key Responsibilities

- Design and implement backend services using Java, Spring Boot, REST APIs, and event-driven patterns.
- Build modern frontend features using React, TypeScript, reusable components, and responsive UI patterns.
- Integrate with external systems such as banking providers, payment processors, identity platforms, and internal enterprise services.
- Participate in architecture discussions, technical design reviews, code reviews, and production-readiness planning.
- Write clean, testable, maintainable code with unit, integration, and end-to-end testing where appropriate.
- Improve observability through structured logging, metrics, traces, alerts, and dashboards.
- Collaborate with QA to troubleshoot defects and support regression testing and release validation.
- Contribute to CI/CD pipelines and deployment automation using Docker and cloud-native tooling.
- Use AI-assisted development tools responsibly to accelerate implementation, testing, and documentation.

Required Technical Skills

- Strong experience with Java 17 or later, Spring Boot, RESTful APIs, and backend service design.
- Solid experience with React, TypeScript, modern JavaScript, HTML, CSS, and frontend state management.
- Experience with PostgreSQL or similar relational databases, SQL optimization, and schema design.
- Experience with Docker, Git, CI/CD pipelines, and cloud environments such as AWS, Azure, or GCP.
- Understanding of authentication, authorization, secure API design, and handling sensitive data.
- Experience designing integrations with third-party APIs and internal enterprise systems.
- Familiarity with asynchronous processing, queues, Kafka, or event-driven architectures is a plus.

AI and Automation Skills

- Practical experience using AI tools for software development, code review, test generation, or documentation.

- Basic understanding of LLM integration patterns, prompt design, structured JSON outputs, and evaluation workflows.
- Experience with LangChain, LangGraph, RAG, vector databases, or agent-based systems is a plus but not mandatory.
- Ability to identify safe and useful AI use cases inside existing engineering workflows.

Soft Skills and Collaboration

- Communicates technical decisions clearly to engineers, product managers, and non-technical stakeholders.
- Works well in distributed teams and takes ownership from discovery through deployment.
- Balances delivery speed with code quality, maintainability, security, and operational stability.
- Comfortable asking questions, challenging assumptions, and proposing pragmatic alternatives.

Interview Focus Areas

Area	What we will evaluate
Backend Design	API design, service boundaries, transactions, reliability, and security.
Frontend Engineering	React component structure, state handling, UX, and maintainability.
Cloud and DevOps	Docker, CI/CD, deployments, observability, and troubleshooting.
Architecture	Trade-offs, scalability, integration design, and technical decision-making.
AI Awareness	Practical use of LLMs, structured outputs, agents, and automation opportunities.

Sample Interview Questions

- 1 Describe how you would design a secure REST API for creating and approving payments.
- 2 How would you structure a React application that consumes multiple backend services?
- 3 What trade-offs would you consider when moving from a monolith to microservices?
- 4 How would you debug a production issue where API latency suddenly increases?
- 5 How could AI agents help improve pull request reviews or developer productivity?

This role description is intended for testing an AI interviewer chatbot workflow, including document ingestion, match analysis, adaptive questioning, and final report generation.
